For Forging Hammer & Roll Grinder Isolation

Series UN Heavy-Duty Spring Isolator

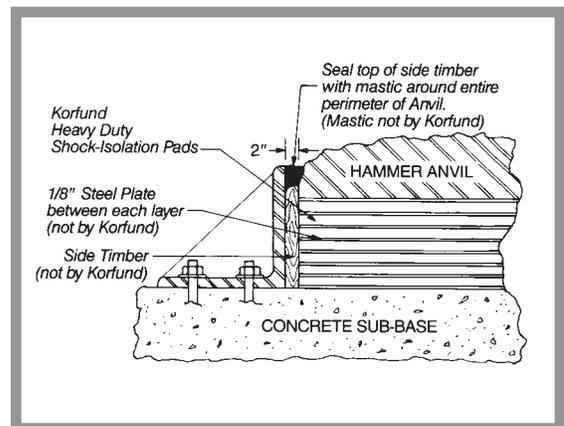

A heavy duty spring isolator most frequently used to support machines on deep concrete foundations such as forging hammers and roll grinders. The structural members cast through the foundation are supported by the UN isolator, and machine and foundation is levelled through adjustment of the isolator. Separate snubbing and damping controls are available. Load range to 35,000 lbs. per isolator and deflections to 1½" result in excellent shock and vibration attenuation.

Installation Configuration

Heavy-Duty Shock Isolation Pad System

Korfund HDSIP is an engineered system. While not as efficient as the Korfund Spring Isolated Foundation System, it is engineered to eliminate up to 75% of the shock formerly transmitted through the timber-pad combination. The Korfund HDSIP System can be installed in existing hammer foundations or on newly constructed conventional foundations.
